### New design features of the Tomoe 847 series result in vastly improved sealing performance under hazardous conditions.

The unique construction of the Tomoe 847 Series provides superior strength and sealing properties essential in applications where conditions are potentially hazardous.

#### High Tension Coil Spring ( 250, 300mm: Coned Disc Spring )

Ensures a stable seal at both the upper and lower gland even at extreme temperatures or when thermal shock occurs.

#### Minimum 3mm PFA Thickness ( 250, 300mm: PTFE )

Seamfree PFA injection moulding( PTFE compression moulding ) on the seat and disc to a minimum thickness of 3mm prevents permeation of dangerous fluids or gases.

#### No Special Gasket Needed

Stable flange sealing performance is ensured by concentric circular grooves on the flange faces, thereby eliminating the need for a special gasket when operating under specified temperatures.

The wider sealing area also ensures minimum "creep" at high temperatures.

Flange sealing mechanism is independent of the seating and gland seals, which ensures there is no loss of line fluid.

Soft gaskets can be used when fitting the valve in the pipeline.

Teflon® is a registered trademark for a fluoride resin produced by Mitsui-DuPont Fluorochemical Co., Ltd.

#### Total Sealing

Valve structure includes primary, secondary and independent tertiary seal,i. e., gland packing. There is also a fourth seal of O-rings on the top/bottom stems, i.e., dust seal.

#### Design features

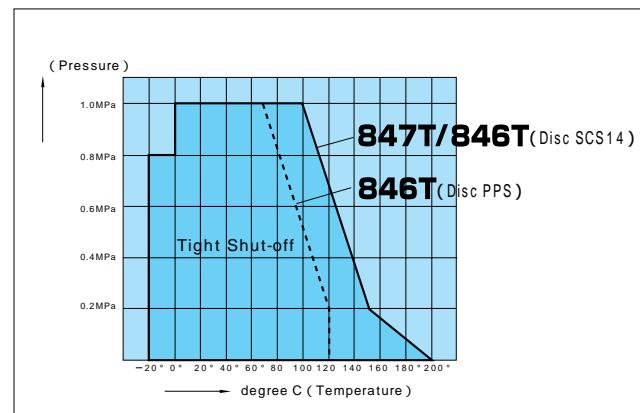

#### LINING ( 50 to 200mm: PFA ) ( 250, 300mm: PTFE )

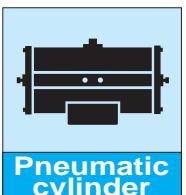

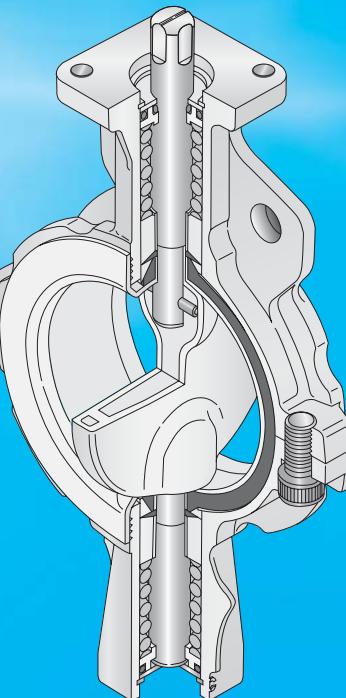

Seamless construction of the valve lining of the 847 Series ensures complete stability in all conditions.

Design and construction of conventional valves often means permeation of fluids or gases, particularly at high temperatures.

By employing an injection moulding method and utilising the properties of Teflon at a minimum thickness of 3mm, the 847 Series is able to eliminate faults common to Teflon lined valves of conventional design.

## **SEAT CONSTRUCTION (250, 300mm: PTFE)**

Another reason for the stable sealing performance of the 847 Series is that no bond is produced between the rubber and Teflon.

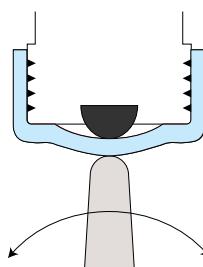

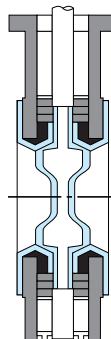

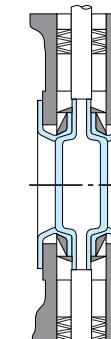

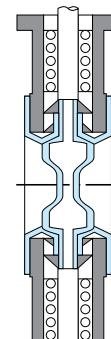

At high temperatures, sealing problems due to separation of the rubber and lining are eliminated. High valve torque caused by expansion of the lining is also eliminated.

### **Typical conventional valve**

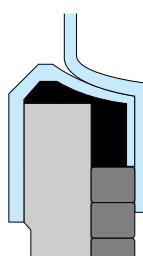

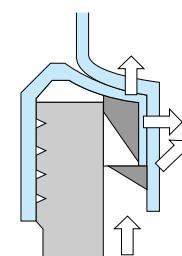

pipe flange damping forces is eliminated because the stem seal arrangement and the pipe flange seal are totally independent.

## **SEALING PROPERTIES**

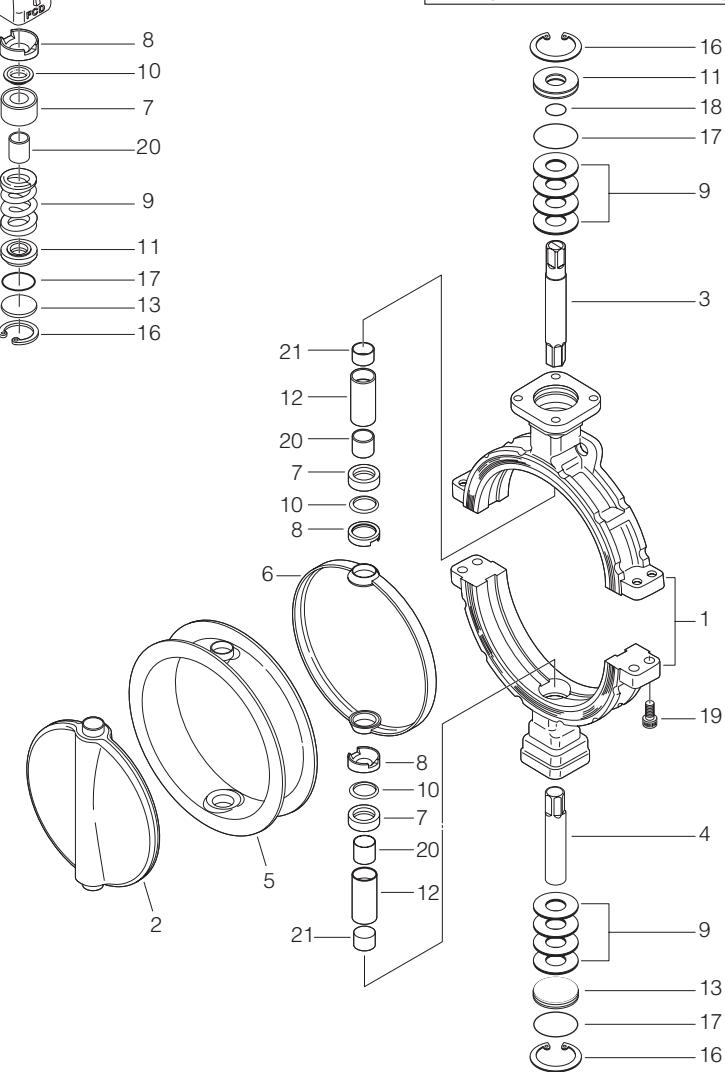

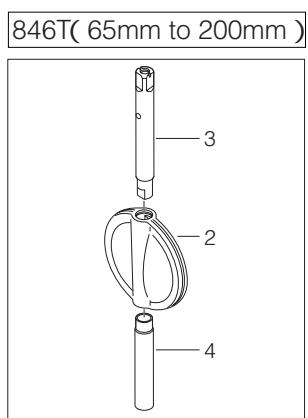

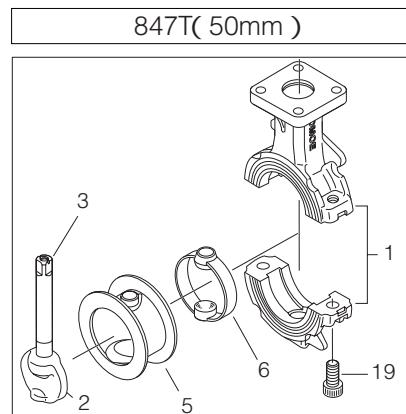

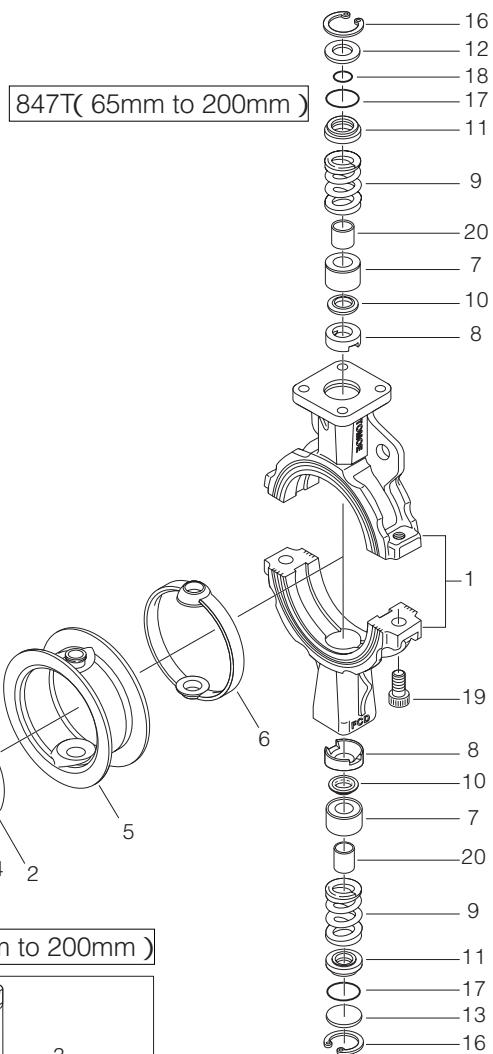

The upper and lower stem housings of the 847 series valve have the same-length high tension coil springs which provide stable sealing performance in cases of temperature change. Conventional valves usually employ a shorter spring in the lower stem housing. This can lead to a loading imbalance on the seat making it difficult to maintain consistent sealing performance.

The sealing design features a triple acting sealing mechanism controlled by the balanced spring forces. ( 250, 300mm: Coned disc springs )

In addition, stem seal leakage caused by excessive

Remark 1: =Applicable

Remark 2: Butterfly valves are inserted into a pipe that was fitted with the disc when fully open.

In cases where you are using a pipe or flange that is less than the minimum inner pipe diameter, use is still possible if means are taken such as inserting a spacer between the valve and flange. For details, please consult us.

The bolt lengths fit the JIS or steel flanges.

Remark: Use thin hexagon nuts for hexagon bolts.(Except for ANSI : nuts for ANSI is heavy nut)

Material: Consult us when other than SS400 (Mild steel)
